1. Opening (1 min)

"Good morning Sir. I will take you through the three stages I am responsible for: Stage 1, Stage 4 and Stage 7. Then I will present Challenges where Software dept need your support."

2. Stage 1: Project Initiation & Idea Definition (about 5 min)

Tell it as a story: problem, solution, scope.

- **Problem:** Job seekers use many different platforms to find vacancies, make CVs and apply. Employers also struggle to publish vacancies and manage applicants.
- **Solution:** Halokazi is one web platform that brings together profiles, CV builder, job search, applications, tracking and alerts.
- **Users:** Job seekers, employers and recruiters, and system administrators.
- **Scope:** Version 1 is a responsive web app with 10 modules. Native mobile apps and AI features are out of scope for now and are planned for future versions.
- **Risks identified:** Fake job ads, fake employer accounts, data breaches and malicious file uploads, each with a control.
- **Status:** Final draft, pending your review and sign-off.

3. Stage 4: System Analysis (about 7 min)

Use the two diagrams from your document. They are the best visual aid you have.

- **Actors:** Three primary actors (Job Seeker, Employer/Recruiter, Admin) and three secondary actors (SMS Gateway, Notification Service, Storage).
- **Process 1 (Job Seeker):** Register, log in, create a CV, apply, the employer reviews, then the job seeker gets a notification.
- **Process 2 (Employer):** Register, upload TIN and Business Licence, the Admin verifies, the employer posts a job, then job seekers are notified.
- **Key point to stress:** Employers need a second, manual verification by an Admin. This is the control for the "fake employer accounts" risk from Stage 1, so you can show that the stages connect.

4. Stage 7: UI/UX Design (about 5 min)

- **What have done:** Multiple screens already been done (job seeker, employer and admin portals) using Figma
- **Design approach:** Responsive for desktop
- **Status:** In progress.

5. Challenge (about 3 min)

"Our newly assigned staff do not yet have computers. This limits collaboration and slows their contribution, especially before development starts. I would like to request computers for them. In the meantime, we will use shared machines and a shared drive so the work continues."
